Welcome	Artifactory Import

The Artifactory Import is used to import an existing Artifactory System Export into Nexus. It is tested against Artifactory 1.2.5 and 2.0.6, but it should be compatible with other versions.

1 - Create an Artifactory "Entire System Export", the same used to migrate between Artifactory versions. It can be zipped or not, both are supported. The options "Include metadata" and "Create a .m2 compatible export" aren't relevant
2 - Place this System Export on the server where Nexus is running.
3 - Specify its location in Step 1. Load Artifactory Configuration, and then you will be presented with a list of available repositories and import options, which is customizable in Step 2. Customize Import on Artifactory Import.

1. Load Artifactory Configuration

Enter the path on the server to the location of your Artifactory System Export and select "Load".

`/usr/local/artifactory-2.2.5/20100820.161445.zip` [Load] ⓘ

2. Customize Import on Artifactory Import
